# Report for Lab 1

## Task 1

Text...

## Task 2

Text...

## Task 3

(a) First, we have created a rule in the *Makefile* to enable performance profiling. In particular, the rule is given by

```
run_perf:
    perf record ./nnetwork    .
```

(b) After running the added rule, we have inspected the generated performance file `perf.data` by running the command `perf report`. Overall, there are three time-consuming operations.

(1) The most time is spent in the `dot` function in the file `vector_ops.cpp`. It requires about 67.62% of running time and computes the product of two matrices. Optimizing it could highly improve the total running time of the training.

(2) The second and third most time-consuming operations are array accesses on vector data-structures with 18.41% and 9.36% respectively. These operations might be optimized by reducing the number of cache misses while accessing vector elements.

(3) Apart from those three operations, there are not any others with significant share on the running time.

(c) To monitor the number of LLC cache misses, we have run the command `perf stat -e LLC-load-misses ./nnetwork`. However, the machine that we have been using did not support for that. The program returned

```
Performance counter stats for './nnetwork':

   <not supported>      LLC-load-misses:u

     412.636442944 seconds time elapsed

     397.622062000 seconds user
       6.620183000 seconds sys    .
```
